Desktop AI Task Assistant

Press a hotkey, describe the task, and it gets done correctly in Jira, Microsoft 365 and any MCP tool

Hotkey anywhere

A Windows tray app. No forms and no switching between tools.

Asks before it acts

Questions until every value is real and checked, then a confirmation card.

Any tool, user-connected

Jira first, then Microsoft 365, ServiceNow and any MCP server.

Nothing changes until every value is checked

1

Open

Press the hotkey and type the task

2

Understand

Works out the action and which tool

3

Look up

Fetches projects, fields and people

4

Ask

One question at a time: choices plus free text

5

Confirm

A card shows every value; assumed ones are flagged

6

Do and report

Acts as you, links the result, logs it

Repeats until it has enough, or you press Stop

Looks up before asking

Lists, people and allowed values are fetched and offered as choices.

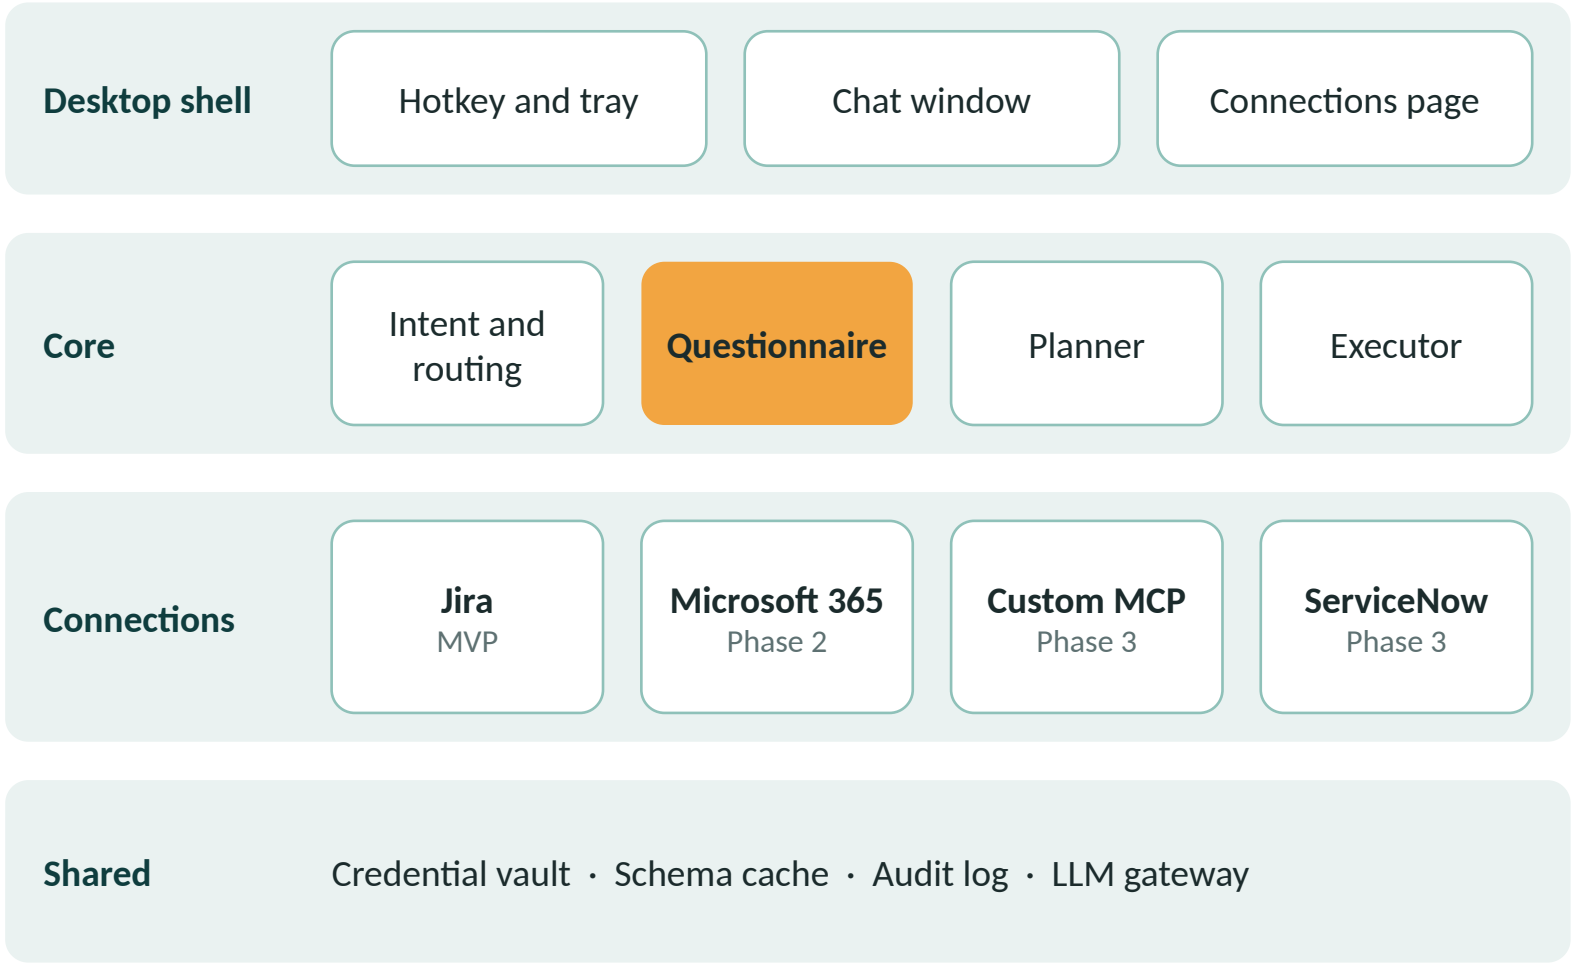

Never invents a value

Stop early and gaps are filled only from tool defaults or your preferences, labelled assumed.

Shows what goes to people

Emails and Teams messages show the exact recipients and full text first.

One core does the work; tools plug in

Built this way because

Local first

Runs on the user's PC. The core has no UI code, so it can move to a server later.

User-managed tools

Users add their own connections, several per tool, and requests are routed between them.

One contract per tool

Every connector offers schema, lookup, validate and execute.

Ship Jira first, then widen the reach

MVP

Jira, done right

- Jira Cloud and Data Center
- Connections and routing
- Questionnaire, confirmation, audit log

PHASE 2

Microsoft 365 workflows

- Teams, Outlook, To Do, OneDrive
- Workflows across Jira and Microsoft 365
- People matched across tools

PHASE 3

Open ecosystem

- Custom MCP connections
- ServiceNow connector
- Quality questions, screenshot capture

PHASE 4

Deflection and automation

- Answers from the knowledge base
- Duplicate detection
- Proactive status updates

Already decided

Local-first core | User-managed connections | Guided + Expert profiles | Jira Cloud + Data Center | Settings per user

Recommended stack: TypeScript on Electron

RECOMMENDED

A · Electron + TypeScript

STRENGTH
Fastest to ship. Best MCP, Claude SDK and chat UI ecosystem.

WATCH
Install size and memory for an always-on tray app

B · Tauri + TypeScript

STRENGTH
Small install, light on memory.

WATCH
Two runtimes (Rust + Node) to package and debug

C · .NET (WinUI 3) + C#

STRENGTH
Best Microsoft 365 sign-in and Intune rollout.

WATCH
Slower chat UI work

Decisions needed, then we split the MVP into build tasks

Team's main language

If the team writes C# daily, choose option C instead.

LLM provider and data rules

Claude via the Anthropic API or Microsoft Foundry, and what data may leave the machine.
